### ■ Correlation Diagram of Push Force and Current Limit Value

R□□: Robot cable

- The correlation between push force and push command value are strictly for reference purposes. Actual numbers may vary slightly.
- The push command value should be 12% or more because the push force will be unstable when the push command value is low.

- (1) There are no limitations on the continuous push time. The duty ratio is also 100% and continuous operation is possible.
- (2) Customer's tooling is to be mounted on the load cell itself. In case any radial or moment load is applied to the load cell, please consider adding the external guides, etc. to offset those side loads.
- (3) Please install a support block when front mounting or back mounting a horizontally mounted actuator that is 150st or more. (Refer to page 34 "Notes When Installing")
- (4) Servo Press with load cell should not be used for pulling motion. It will damage the load cell.
